The Hockey Data

Glen Healey, commenting on an NHL broadcast:

Referees are predictable. The flames have had three penalties, I guarantee you the oilers will have three.

Well, *guarantee* seems a bit strong, but there is something to it.

How predictable are referees?

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Got data on every penalty in every
(regular season) game for 7 seasons around the time they
switched from one referee to two.

For each penalty (after the first one in a game) let

`revcall =`

1 if current penalty and previous
penalty are on different teams,

0 otherwise.

*You know a penalty has just been called,
which team is it on?
is it a reverse call on the other team???*

Mean of `revcall` is .6 !

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

For every penalty (after the first one in a game) we have:

Table: Variable Descriptions

Variable	Description	Mean	Min	Max
<i>Dependent variable</i>				
revcall	1 if current penalty and last penalty are on different teams	0.589	0	1
<i>Indicator-Variable Covariates</i>				
ppgoal	1 if last penalty resulted in a power-play goal	0.157	0	1
home	1 if last penalty was called on the home team	0.483	0	1
inrow2	1 if last two penalties called on the same team	0.354	0	1
inrow3	1 if last three penalties called on the same team	0.107	0	1
inrow4	1 if last four penalties called on the same team	0.027	0	1
tworef	1 if game is officiated by two referees	0.414	0	1
<i>Categorical-variable covariate</i>				
season	Season that game is played		1	7

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Table: Variable Descriptions

Variable	Description	Mean	Min	Max
<i>Other covariates</i>				
timeingame	Time in the game (in minutes)	31.44	0.43	59.98
dayofseason	Number of days since season began	95.95	1	201
numpen	Number of penalties called so far (in the game)	5.76	2	21
timebetpens	Time (in minutes) since the last penalty call	5.96	0.02	55.13
goaldiff	Goals for last penalized team minus goals for opponent	-0.02	-10	10
gf1	Goals/game scored by the last team penalized	2.78	1.84	4.40
ga1	Goals/game allowed by the last team penalized	2.75	1.98	4.44
pf1	Penalties/game committed by the last team penalized	6.01	4.11	8.37
pa1	Penalties/game by opponents of the last team penalized	5.97	4.33	8.25
gf2	Goals/game scored by other team (not just penalized)	2.78	1.84	4.40
ga2	Goals/game allowed by other team	2.78	1.98	4.44
pf2	Penalties/game committed by other team	5.96	4.11	8.37
pa2	Penalties/game by opponents of other team	5.98	4.33	8.25

$n = 57,883$.

How is `revcall` related to the variables?

	<code>inrow2=0</code>	<code>inrow2=1</code>
<code>revcall=0</code>	0.44	0.36
<code>revcall=1</code>	0.56	0.64

`inrow2=1`:

If the last two calls were on the same team then 64% of the time, the next call will *reverse* and be on the other team.

`inrow2=0`:

If the last two calls were on different teams, then the frequency of reversal is only 56%.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Of course,

we want to relate revcall to all the other variables jointly!

Well, we could just run a logit,

*but with all the info, can we,
fairly automatically,
get a better fit than a logit gives?*

What could we try?

Data Mining and Analysis STATS202 Description

In the Information Age, there is an unprecedented amount of data being collected and stored by banks, supermarkets, internet retailers, security services, etc.

So, now that we have all this data, what do we with it?

The discipline of data mining and analysis provides crunchers with the tools and framework to discover meaningful patterns in data sets of any size and scale. It allows us to turn all of this data into valuable, actionable information.
In this course, learn how to explore, analyze, and leverage data.

Topics Include

- Decision trees
- Neural networks
- Association rules
- Clustering
- Case-based methods
- Data visualization

Intro

Modern Applied Statistics: Data Mining

STATS315B

Online

Description

Examine new techniques for predictive and descriptive learning using concepts that bridge gaps among statistics, computer science, and artificial intelligence.

This second sequence course emphasizes the statistical application of these areas and integration with standard statistical methodology. The differentiation of predictive and descriptive learning will be examined from varying statistical perspectives.

Topics Include

- Classification & regression trees
- Multivariate adaptive regression splines
- Prototype & near-neighbor methods
- Neural networks

Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Recall:

How do you fit a tree?

(i)

Build a big tree by greedy search.

(ii)

Prune it back using cross-validation.

Ensemble Methods:

A single tree can be interpretable, but it does not give great in-sample fit or out-of-sample predictive performance.

Ensemble methods combine fit from many trees to give an overall fit.

They can work great!

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Let's try Random Forests (Leo Brieman).

- ▶ Build many (a forest) of very big trees, each of which would overfit on its own.
- ▶ Randomize the fitting, so the trees vary (eg. In choosing each decision rule, randomly sample a subset of variables to try, randomly resample data).
- ▶ To predict, average (or vote) the result of all the trees in the forest.

For example, *build a thousand trees !!!*

Have to choose the number of trees in the forest and the randomization scheme.

Wow! (crazy or **brilliant?**)

My impression is that Random Forests is the most popular method.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Let's try Random Forests and trees of various sizes.

For Random Forests we have to choose the number of trees to use and the number of variables to sample.

I'll use the default for number of variables and try 200,500, and 1500 trees in the forest.

We have **57,883** observations and a small number of variables so let's do a simple train-test split.

train:

use **47,883** observations to fit the models.

test:

use **10,000** out-of-sample observations to see how well we predict.

Loss for trees of different sizes, and 3 forests of different sizes (each forest has many big trees!).

Smaller loss is better.

Loss is measured by the deviance ($-2 \times \log\text{-likelihood}$ (out-of-sample)).

Logit does best!

Let's try **boosting** and **BART**.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

GBM is Jerry Friedman's boosting.
The number is the number of trees used.
Other parameters left at default.

BART is Bayesian Additive Regression Trees.
We used the default prior and 200 trees.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

BART

We want to “fit” the fundamental model:

$$Y_i = f(X_i) + \epsilon_i$$

BART is a Markov Monte Carlo Method that draws from

$$f \mid (x, y)$$

We can then use the draws as our inference for f .

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

To get the draws, we will have to:

- ▶ Put a prior on f .
- ▶ Specify a Markov chain whose stationary distribution is the posterior of f .

Simulate data from the model:

$$Y_i = x_i^3 + \epsilon_i \quad \epsilon_i \sim N(0, \sigma^2) \text{ iid}$$

```
n = 100
sigma = .1
f = function(x) {x^3}
set.seed(14)
x = sort(2*runif(n)-1)
y = f(x) + sigma*rnorm(n)
xtest = seq(-1,1,by=.2)
```

Here, *xtest* will be the *out of sample* *x* values at which we wish to infer *f* or make predictions.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

```
plot(x,y)
points(xtest,rep(0,length(xtest)),col="red",pch=16)
```

Red is xtest.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

```
-----  
library(BayesTree)  
rb = bart(x,y,xtest)  
length(xtest)  
[1] 11  
dim(rb$yhat.test)  
[1] 1000  11  
-----
```

The (i, j) element of `yhat.test` is
the i^{th} draw of f evaluated at the j^{th} value of `xtest`.

1,000 draws of f , each of which is evaluated at 11 `xtest` values.

```
-----  
plot(x,y)  
lines(xtest,xtest^3,col="blue")  
lines(xtest,apply(rb$yhat.test,2,mean),col="red")  
qm = apply(rb$yhat.test,2,quantile,probs=c(.05,.95))  
lines(xtest,qm[1,],col="red",lty=2)  
lines(xtest,qm[2,],col="red",lty=2)  
-----
```

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Example: Out of Sample Prediction

Did out of sample predictive comparisons on 42 data sets.
(*thanks to Wei-Yin Loh!!*)

- ▶ $p=3 - 65$, $n = 100 - 7,000$.
- ▶ for each data set 20 random splits into 5/6 train and 1/6 test
- ▶ use 5-fold cross-validation on train to pick hyperparameters (except BART-default!)
- ▶ gives $20 \times 42 = 840$ **out-of-sample predictions**, for each prediction, divide rmse of different methods by the smallest

- + each boxplots represents 840 predictions for a method
- + 1.2 means you are 20% worse than the best
- + BART-cv best
- + BART-default (use default prior) does amazingly well!!

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel

Trees

Consensus Bayes

End

A Regression Tree Model

Let T denote the tree structure including the decision rules.

$M = \{\mu_1, \mu_2, \dots, \mu_b\}$ denotes the set of bottom node μ 's.

Let $g(x; T, M)$, be a regression tree function that assigns a μ value to x .

A single tree model:

$$y = g(x; T, M) + \epsilon.$$

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

A coordinate view of $g(x; T, M)$

Easy to see that $g(x; T, M)$ is just a step function.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

The BART Model

Intro

$$Y = g(x; T_1, M_1) + g(x; T_2, M_2) + \dots + g(x; T_m, M_m) + \sigma z, \quad z \sim N(0, 1)$$

$m = 200, 1000, \dots, \text{big}, \dots$

$f(x | \cdot)$ is the sum of all the corresponding μ 's at each bottom node.

Such a model combines additive and interaction effects.

Complete the Model with a Regularization Prior

$$\pi(\theta) = \pi((T_1, M_1), (T_2, M_2), \dots, (T_m, M_m), \sigma).$$

π wants:

- ▶ Each T small.
- ▶ Each μ small.
- ▶ “nice” σ (smaller than least squares estimate).

We refer to π as a regularization prior because it keeps the overall fit from getting “too good”.

In addition, it keeps the contribution of each $g(x; T_i, M_i)$ model component small, each component is a “weak learner”.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

BART MCMC

$$Y = g(x; T_1, M_1) + \dots + g(x; T_m, M_m) + \sigma z$$

plus

$$\pi((T_1, M_1), \dots, (T_m, M_m), \sigma)$$

First, it is a “simple” Gibbs sampler:

$$\begin{array}{l|l} (T_i, M_i) & (T_1, M_1, \dots, T_{i-1}, M_{i-1}, T_{i+1}, M_{i+1}, \dots, T_m, M_m, \sigma) \\ \sigma & (T_1, M_1, \dots, T_m, M_m) \end{array}$$

To draw $(T_i, M_i) | \cdot$ we subtract the contributions of the other trees from both sides to get a simple one-tree model.

We integrate out M to draw T and then draw $M | T$.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

To draw T we use a Metropolis-Hastings within Gibbs step.
We use various moves, but the key is a “birth-death” step.

... as the MCMC runs, each tree in the sum will grow and shrink, swapping fit amongst them

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Build up the fit, by adding up tiny bits of fit ..

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Nice things about BART:

- ▶ don't have to think about x 's (compare: add x_j^2 and use lasso).
- ▶ don't have to prespecify level of interaction (compare: boosting in R)
- ▶ competitive out-of-sample.
- ▶ stable MCMC.
- ▶ stochastic search.
- ▶ simple prior.
- ▶ uncertainty.
- ▶ small p and big n .

Intro

Trees and

Consensus Bayes

End

Back to Hockey

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

How can I use BART to understand the hockey data??

I have a problem !!!.

The sum of trees model is not interpretable.

Other methods (neural nets, random forests, ..) have the same problem.

Well, you can look into the trees for things you can understand:

- what variables get used.
- what variables get used together in the same tree.

Or, estimate $p(\text{revcall} = 1 \mid x)$ at lots of interesting x and see what happens!!

In practice, people often make millions of predictions.

We'll keep it simple for the hockey data:

(i)

Change one thing at a time
(careful! you can't increase numpens without increasing time-in-game)

(ii)

Do a 2^5 factorial experiment where we move 5 things around, with each thing having two levels.

This will give us 32 x vectors to estimate $p(\text{revcall} = 1 \mid x)$ at.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Change the binary x 's one at a time:

Top panel is the posterior distribution of $p(\text{revcall})$ at various x .

Bottom panel is the posterior distribution of the *difference* in $p(\text{revcall})$ due to a change in x .

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

PBART: Parallel Bayesian Additive Trees

Dave Higdon said,

we tried your stuff (the R package BayesTree) on the analysis of computer experiments and it seemed promising but it is too slow”.

Recode with MPI to make it faster!!

MPI: Message Passing Interface.

Two Steps.

Step 1. Rewrote serial code so that it is “leaner”.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Lean Code:

```
class tree {
public:
...
private:
    //-----
    //parameter for node
    double mu;
    //-----
    //rule: left if  $x[v] < xinfo[v][c]$ 
    size_t v;
    size_t c;
    //-----
    //tree structure
    tree_p p; //parent
    tree_p l; //left child
    tree_p r; //right child
};
```

1 double, two integers, three pointers.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Step 2:

Parallel MPI implementation.

Have $p + 1$ processor cores.

Split data up into p equal chunks.

- ▶ core 0 is the master. It runs the MCMC.
- ▶ core i , $i = 1, 2, \dots, p$ has data chunk i in memory.
- ▶ Each core has the complete model $((T_j, M_j)_{j=1}^m, \sigma)$ in memory.

Note: with MPI cores and associated memory may be on different machines.

Compare with openmp where the memory must be shared.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

- ▶ core 0 is the master. It runs the MCMC.
- ▶ core i , $i = 1, 2, \dots, p$ has data chunk i in memory.
- ▶ Each core has the complete model $((T_j, M_j)_{j=1}^m, \sigma)$ in memory.

Each MCMC step involves:

1. master core 0, initiates an MCMC step (e.g. change a single tree, draw σ).
2. master core 0, sends out a compute request (needed for MCMC step) to each slave node $i = 1, 2, \dots, p$.
3. Each slave core i computes on it's part of the data and sends the results back to master core 0.
4. master core 0 combines the results from the p slaves and updates the model using the results (e.g. changes a tree, obtains new σ draw).
5. master core 0, copies new model state out to all the slave cores.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Keys to Parallel implementation:

- ▶ Lean model representation is cheap to copy out to all the slave cores.
- ▶ MCMC draws all depend on simple conditionally sufficient statistics which may be computed on the separate slave cores, cheaply sent back to the master, and then combined.

Even though the the overall model is complex, each local move is simple !!

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Simple Sufficient Statistics:

Consider the birth-death step:

propose a more complex tree

propose a simpler tree

Given a tree, we just have $\{R_{ij}\} \sim N(\mu_j, \sigma^2)$ iid in j^{th} bottom node, where R is resids from the the other trees..

Evaluating a birth-death is just like testing equality of two normal means with an independent normal prior.

Sufficient statistic is just $\sum_i r_{ij}$ for two different j corresponding to left/right child bottom nodes.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Timing

We did lots of timing exercises to see how well it works.

Here $n = 200,000$, $p + 1 = 40$, time is to do 20,000 iterations.

processors	run time (s)
2	347087
4	123802
8	37656
16	16502
24	9660
30	6303
40	4985
48	4477

$40/8=5$. $39/7 = 5.6$. $37656/4985=7.5$.

With 5 times as many processors we are 7.5 times faster.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Here is a plot of the times.

T_{ser} : time with serial code; T_{par} : time with parallel code.
Ideally you might hope for

$$T_{par} = \frac{T_{ser}}{p + 1}.$$

So we plot $\frac{1}{T_{par}}$ vs. $p + 1$.

Looks pretty
linear.

Jump at about
 $p + 1 = 30$.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Here we look at the *efficiency* which is

$$E = \frac{T_{ser}}{(p+1)T_{par}}$$

If $T_{par} = \frac{T_{ser}}{(p+1)}$ this would equal 1.

We timed 27 runs with $m \in \{50, 100, 200\}$,
 $n \in \{100000, 500000, 1000000\}$, $p+1 \in \{9, 17, 25\}$.

If you have too few observations on a core the cost of message passing eats into the speed.

60% of $p+1$ times
faster is still pretty
good!

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Consensus Bayes

At Google they were interested, but also politely scoffed.

Their attitude is that on a typical large network the communication costs will really bite.

Some of our timings were on a shared memory machine with 32 cores over which we had complete control, but some were on a cluster where you buy computes and these are over several machines.

In any case, our setup may not work with the kind of machine setup they want to use at Google.

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

So, a simpler idea is *consensus Bayes*.

Suppose you have a “cluster” of p “nodes”.

Again, you split the data up into p chunks (no master this time!).

Then you assign each node one of the chunks of data.

Then you simply run a separate MCMC on each “node” using its chunk of data.

If you want to predict at x , let $f_{ij}(x)$ be the i^{th} draw of f on node j .

Then you get a set of consensus draws by

$$f_i^c(x) = \sum w_j f_{ij}(x), \quad w_j = 1/\text{Var}(f_{ij}(x)).$$

Intro

Trees and
Ensemble Methods

BART

PBART: Parallel
Bayesian Additive
Trees

Consensus Bayes

End

Consensus Bayes also involves an adjustment of the prior.

The idea is that

$$p(\theta | D) \propto L(D)p(\theta) \propto \prod_{j=1}^p L(D_j)p(\theta)^{1/p}.$$

where D is all the data and D_j is the data on chunk j .

So, you should use prior $p(\theta)^{1/p}$ on each node.

This can work really well for simple parametric models, but BART is “non-parametric” with variable dimension.

Simulated data.

$n = 20,000$. $k = 10$. $p = 30$.

- (1) True $f(x)$ vs. serial BART $\hat{f}(x)$.
- (2) True $f(x)$ vs. consensus BART $\hat{f}(x)$,
no prior adjustment.
- (3) True $f(x)$ vs. consensus BART $\hat{f}(x)$, prior adjustment.

Consensus BART without prior adjustment is awesome!

Trees

Consensus Bayes

End

Top row: consensus no prior adjustment.
Bottom row: consensus prior adjustment.

First column, posterior mean of $f(x)$ vs. serial BART posterior mean.
Second column, 5% quantile vs serial BART.
Third column, 95% quantile vs serial BART.

Consensus BART without prior adjustment is awesome!

Consensus Bayes

End

Good:

Both approaches make BART a usable technique with large data sets and seem to work very well.

Need to think more about how to make prior adjustment (if any) for Consensus Bayes.

Bad:

While PBART is on my webpage, we need to make it easier to use.

We have some R functions written and are testing, but it is not available yet.

Consensus Bayes

End

Very Bad:

Have been promising new version of package for a while.

New faster version (with parallel computing) will be there soon!!
